City Care Clinic

📍 Mirpur, Dhaka · 👤 15 staff · 🏢 Healthcare

ASSETS — What does this business have?

- 3 Windows PCs — 2 running Windows 7 (end of support since 2020)
- Patient records stored in Excel files on the shared reception PC
- Patient appointment booking website — HTTP only (no HTTPS)
- Single Wi-Fi network shared by staff AND patients in the waiting room
- Staff WhatsApp group used to share patient test results and updates
- USB drives passed freely between all 3 PCs to transfer files
- CCTV recorder box connected to the office Wi-Fi network
- One laser printer — network connected, accessible from any PC

KNOWN WEAKNESSES — What has the owner admitted?

- ⚡ ALL staff share one password: 'clinic2023' — written on sticky note on monitor
- ⚡ No antivirus installed on the two Windows 7 computers
- ⚡ Patient data backed up weekly to the receptionist's personal Gmail account
- ⚡ No spam filtering — receptionist opens all incoming email
- ⚡ Website contact form collects patient phone + address — sent unencrypted

THINK ABOUT — Auditor questions to guide your analysis

1. What data could a patient in the waiting room capture from the shared Wi-Fi?
2. If the receptionist's Gmail is hacked, what patient data is exposed?
3. Why is Windows 7 specifically dangerous — what happened in 2020?
4. What is the risk of using WhatsApp to share patient test results?
5. If a USB drive gets malware from an outside source, what happens?

YOUR TASK (complete in your workbook):

1. Identify 5 threats — name each asset, the threat, attack type, missing control
2. Complete the Asset Inventory — minimum 8 assets from this profile
3. Prepare a 3-minute presentation of your top 3 findings
