ASSETS — What does this business have?

- Linux GPS tracking server — tracks 20 trucks in real-time, sits on internal LAN
- Android driver mobile app — connects to GPS server over mobile internet
- QuickBooks accounting — cloud version, browser access only
- TP-Link network printer — admin portal accessible to all LAN users
- WordPress company website — version 5.2, last updated 2021
- FTP server — used to transfer monthly payroll files to accountant
- IP cameras at 3 depots — remote access enabled, internet-connected
- Shared network drive — driver schedules and customer delivery addresses

⚠️ KNOWN WEAKNESSES — What has the owner admitted?

- ⚡ WordPress 5.2 is end-of-life — over 40 known CVEs with no patch available
- ⚡ FTP sends payroll files (salary, NID numbers) completely unencrypted
- ⚡ Network printer admin page accessible to anyone on the office LAN
- ⚡ GPS tracking server still has the default SSH root password
- ⚡ Depot IP cameras accessible from internet using admin/admin credentials

🔍 THINK ABOUT — Auditor questions to guide your analysis

1. If someone intercepts the FTP payroll transfer, what data do they get?
2. What is the risk of an internet-connected IP camera with default credentials?
3. WordPress 5.2 CVE-2019-9978 allows remote code execution. What does this mean?
4. The printer admin page — what could an attacker do with printer access?
5. The GPS server is on the same LAN as all office PCs. Why is this risky?

📋 YOUR TASK (complete in your workbook):

1. Identify 5 threats — name each asset, the threat, attack type, missing control
2. Complete the Asset Inventory — minimum 8 assets from this profile
3. Prepare a 3-minute presentation of your top 3 findings
