Retail / Food
Service**JavaJoy Café Chain**

📍 Dhaka (3 branches) · 👤 25 staff · 🏪 Retail / Food Service

📄 ASSETS — What does this business have?

- Windows XP POS (point-of-sale) system at each of 3 branches — handles card payments
- Customer loyalty app — name, phone, email for 8,000 customers
- Online ordering website — customers enter card details to pay
- Customer database — backed up weekly to a public Google Drive folder
- CCTV cameras at each branch — connected to branch Wi-Fi
- Manager's personal laptop — used for business email and QuickBooks
- Branch Wi-Fi — customers and staff use same network
- Payment card reader (POS terminal) at each branch

⚠️ KNOWN WEAKNESSES — What has the owner admitted?

- ⚡ Windows XP — Microsoft stopped ALL security updates in April 2014
- ⚡ Online ordering website uses HTTP — card data is sent in plain text
- ⚡ Customer database Google Drive folder set to 'Anyone with link can view'
- ⚡ No PCI-DSS compliance for card payment handling
- ⚡ Manager uses personal laptop for business — no separation of personal/work data

🔍 THINK ABOUT — Auditor questions to guide your analysis

1. What is PCI-DSS? Why does a café taking card payments need to follow it?
2. A customer connects to the branch Wi-Fi. What can they intercept?
3. The Google Drive folder is public. Who can access the 8,000 customer records?
4. Windows XP has not been patched since 2014. What attacks specifically target it?
5. HTTP online ordering — if you are on the same Wi-Fi, how do you steal card data?

📄 YOUR TASK (complete in your workbook):

1. Identify 5 threats — name each asset, the threat, attack type, missing control
2. Complete the Asset Inventory — minimum 8 assets from this profile
3. Prepare a 3-minute presentation of your top 3 findings
